

Save Energy for Benefit of Self and Nation

Do you know ?

When your fan is on... your electricity meter is also on

TIPS TO SAVE ENERGY

How often are lights, televisions, stereos left on in your house when there is no-one in the room because 'you'll be right back'?

- Buy energy-saving appliances.
- Turn off lights & fans whenever they are not in use.
- Open curtains and blinds till you have natural day light.
- Switch to CFL lights wherever possible. A 40 W tubelight is equivalent to 100 W bulb (30-38%).
- Keep bulbs, tubes, etc. clean - dust can decrease lighting levels by 20 to 30%.
- Set water heater at optimum temperature level.
- Avoid frequent opening & closing of refrigerator & air-conditioned rooms.
- While maintaining safe lighting conditions for work areas, remove lamps where you have more lighting than you really need.
- Providing the right lighting can save up to 15 percent on your lighting bill.
- For really big energy savings, replace the incandescent floodlight bulbs with the new fluorescent lamps.
